

**ABSTRACT**

5       A method of precisely determining velocity of  
propagation and the location of a fault on an  
electric transmission line, using a system of high  
frequency transmitter and receiver combinations to  
monitor and detect high frequency bursts produced by  
the transmitters and by faults, including memory and  
analysis capability to store and analyze high  
10      frequency data before and after a detected fault.
